

# Extra large mountingplate for cable ladders

Sometimes more space is required for a larger junction box or similar on cable ladders. The solution has previously been to place two mounting plates side by side. Now we are launching a larger mounting plate that is a full 300 mm wide and it fits all our cable ladders. It is easily screwed into the perforated side profile with our MP-screw. The plate can be mounted in outdoor environments without any issues.

Art.no	Width
113Z4	300 mm

## Z4

It is generally known that hot-dip galvanized products can be used outdoors, but the process is not gentle to the environment. It involves transportation to and from the facility for galvanizing after manufacturing. We have developed a new material that we call Z4. The plate is pre-treated from the steel mill and self heals after processes such as drilling and hole punching.

The surface treatment corresponds to a coating thickness of at least 85  $\mu\text{m}$ , compared to a traditional hot-dip galvanized product which is normally a maximum of 60  $\mu\text{m}$ .

Approved for environments up to class C4.
