

Strapping profile in Z4 material!

MP Bolagen's renowned strapping profile 800Z has gained another sibling, now made from Z4 material, which can cope with the same tough environments but with less impact on the environment.

800 Z4 is thinner than its predecessor, which means it is both lighter to carry and easier to bend.

The strapping profile is also available in a stainless steel and acid-resistant version, to cope with really tough environments.

Length	Z4
2.5 m	MP-800 Z4

Z4

It is generally known that hot-dip galvanised products can stay outdoors, although the process is not kind to the environment. It involves transport to and from the hot-dip galvanising facility after manufacture.

We have developed a new material, which we refer to as Z4. The plate is pre-treated from the steelworks and heals itself after e.g. hole punching and similar operations.

The surface treatment is equivalent to at least 85 µm, compared to a traditional hot-dip galvanised product which is normally max 60 µm. (Certain accessories cannot be manufactured in Z4, in which case a hot-dip galvanised product should be selected.)

Approved for all environments up to class C4.

Hours of exposure, salt spray test!
